Abstract

The literature-based review was constructed discussing three types of yellow woods plant from Indonesia, including Arcangelisia flava, Fibraurea tinctoria, and Coscinium fenestratum. Yellow wood plants are widely used as traditional medicine due to its activities that were pharmacologically studied. Those activities include antiplasmodial, cytotoxic, antioxidant, toxicity, antidiabetic, anticolesstrolia, antihypertensive to liver activity, and health-behavior changes in experimental animals.

Keywords: review, pharmacologically studies, Arcangelisia flava, Fibraurea tinctoria, Coscinium fenestratum

Introduction

Indonesia widely uses plants as a source of natural-based medicines [1], one of which is a Kayu kuning or yellow wood plant or yellow root, namely Arcangelisia flava, Fibraurea tinctoria, and Coscinium fenestratum [2]. All three of these plants exhibit antimalarial effects with excellent IC₅₀ in inhibiting the growth of P. falciparum [3]. Researchers also found that the effects did not worked synergically toward the liver due to inhibition of the cytochrome P3A4 by chloroform extract and chloroform insoluble fraction from F. tinctoria plants with IC₅₀ 3.4 μg/mL [4] and 5.1 μg/mL [5]. In contrast, the methanol extract of C. fenestratum (60 mg/kgBB) showed a hepatoprotective effect for 90 days on the induction of carbon tetrachloride [6] With a variety of the impact that corresponds, and some other effects are also the opposite of these three types of plants, the activities that were tested pharmacologically will be further discussed.
Pharmacological Activities of Three Kinds "Kayu kuning": *Arcangelisia flava*, *Fibraurea tinctoria* and *Coscinium fenestratum* – an Short Review

**Discussion**

The taxonomy and morphology of Kayu kuning.

*Arcangelisia flava*

Kingdom : Plantae  
Order : Tracheophyta  
Subclass : Magnoliopsida  
Suborder : Ranunculales  
Family : Menispermaceae  
Genus : Arcangelisia  
Species : *Arcangelisia flava* (L.) Merr.

This plant exhibits a bright yellow wood color, and the leaves grow upwards with an almost round leaf shape [7]. These wild plants can be found on rocky beaches or on the edge of forests [8] (Figure 1).

*Fibraurea tinctoria*

Kingdom : Plantae  
Order : Tracheophyta  
Subclass : Magnoliopsida  
Suborder : Ranunculales  
Family : Menispermaceae  
Genus : Fibraurea Lour  
Species : *Fibraurea tinctoria* Lour.

This is a woody plant, with trees that can grow up to 40 m in diameter. This plant exhibits yellow stems and twigs. The oval-shaped leaves resemble betel leaves but do not exhibit a distinctive aroma [9] (Figure 2).

*Coscinium fenestratum*

Kingdom : Plantae  
Order : Tracheophyta  
Subclass : Magnoliopsida  
Suborder : Ranunculales  
Family : Menispermaceae  
Genus : Coscinium Colebra  
Species : *Coscinium fenestratum* (Gaertn.)

This plant can grow very tall, with a stem diameter of up to 10 cm, in addition to being yellow on the inside and brown on the outside [10]. The shape of the leaves in this plant is like an elongated betel leaf (Figure 3).

The traditional utilization of Kayu kuning

The recorded traditional utilization of kayu kuning plants is recorded below (Table 1).

Pharmacological activities of Kayu kuning

Kayu kuning or yellow wood plants demonstrate efficacy that has been tested pharmacologically. Some of the results of the study are as follows:

**Antimicrobial**

Ethanol extract of *A. flava* root can inhibit *Bacillus cereus* ATCC 14579 and *Staphylococcus aureus* ATCC 25923, indicated by the clear zone formation of 9.6 mm at a dose of 10 mg/mL and 17.2 mm at a dose of 5 mg/mL, respectively [17].

Chloroform, n-hexane, and ethyl acetate extracts of *A. flava* can inhibit *Aeromonas hydrophilia* with clear zones of 17.25, 13.18, and 11.16 mm at a dose of 20 mg/mL, respectively [18].

The ethanol extract of *A. flava* vines of the branches resulted inactivity to *S. aureus* with a MIC value of 0.25 µg/mL [19]. The 96% methanol extract of the leaves provides antibacterial activity against *Pseudomonas fluorescens* ATCC 49642 with MIC values 14.17 µg/mL [20].

Dichloromethane extract: methanol (1: 1) leaves and stems of *F. tinctoria* can inhibit *Bacillus cereus* with 10 mm inhibition zone diameters at 400 µg/disc, MIC 25 µg/mL, and MBC > 100 µg/mL. This extract also demonstrates the ability to inhibit the growth of *S. aureus* with inhibition zone diameters of 10 mm at a dose of 400 µg/disc, MIC 50 µg/mL, and MBC > 100 µg/mL [21].

The methanol extract of *C. fenestratum* stems can inhibit *Nisseria gonorrhoeae* ATCC 49226 with MIC values of 47.39 µg/mL [22].

**Antifungal**

The water extract of *A. flava* plant stem can inhibit the growth of *Candida albicans* with a MIC value of 10 mg/mL and a MFC of 4%. This extract also showed inhibitory effects on *Trichophyton mentagrophytes* with a MIC value of 10 mg/mL and MFC of 5% [8].

**Antiplasmodial**

Plant extracts of *A. flava* and *F. tinctoria* demonstrate the ability to inhibit the growth of Plasmodium, which is shown in Table 2 [23].

**Cytotoxic**

*A. flava* and *F. tinctoria* also contain cytotoxic properties, in addition to antiplasmodial properties (Table 3).

**Antiploriferation**

The methanol extract and water fraction of *F. tinctoria* demonstrate the ability to inhibit the proliferation of Human Colon Cancer HT-29 cells with IC50 values of 17.12 and 9.29 µg/mL, respectively. The methanol extract and plant water fraction also demonstrate the ability to inhibit the proliferation of human skin fibroblasts with IC50 values of both > 100 µg/mL [25].

**Antioxidant**

Petroleum ether, chloroform, methanol, and water extracts of *F. tinctoria* demonstrate the ability to reduce DPPH radicals with EC50 values > 100, 78.8, 83.6, and > 100 µg/mL [14].

**Anti-hypertension**

A 50% ethanol stem extract of *C. fenestratum* shows antihypertensive activity in experimental dogs, which were anesthetized under normal blood pressure conditions. Extracts at doses of 5–40 mg/kg given intravenously reduce blood pressure by 20%–83% with effects lasting for 160 minutes [27].

**Anti-hypercholesterolemia**

The methanol extract of *A. flava* stem demonstrates the ability to reduce total cholesterol by 25.49 mg/dL, total triglycerides by 5.5 mg/dL, and LDL by 9.14 mg/dL, in addition to increasing HDL values by 14.8 mg/dL in a dose of 500 mg/kg. This activity was obtained from testing on rat animals induced by high-fat and fructose foods for 45 days [28].

**Anti-diabetes**

The ethanol extract of *F. tinctoria* stem demonstrates the ability to reduce plasma glucose concentration in the oral condition of maltose-loaded normal mice at a dose of 250 mg/kg BW [29].
Pharmacological Activities of Three Kinds "Kayu kuning": Arcangelisia flava, Fibraurea tinctoria and Coscinium fenestratum – an Short Review

Analgesic

The methanol extract of C. fenestratum stem demonstrates the analgesic effect at a dose of 8 mg/kg BW. This effect is reported from the response of experimental Swiss albino mice to induce the tail flick method (response to snapping the tail) using heat as a pain inducer. The ability to withstand pain was demonstrated by experimental animals for 3.30 minutes after 60 minutes of extract administration [30]

Hepatoprotector and Hepatotoxic

Chloroform extract and a non-polar portion of F. tinctoria chloroform showed inhibition of the cytochrome P3A4 enzyme with IC values of 3.4 μg/mL [5] and 5.1 μg/mL [4]. Conversely, the methanol extract of C. fenestratum at a dose of 60 mg/kg BW showed a protective effect on the liver of mice by reducing the free radicals produced by carbon tetrachloria for hepatotoxic conditions [6]

Conclusion

Arcangelisia flava, Fibraurea tinctoria and Coscinium fenestratum have various properties for the treatment and maintaining health, that have proven their biological activity in various research methods.
